The super-thin aluminum honeycomb laminated panels and the aluminum plastic laminated panels boast the following four major features:

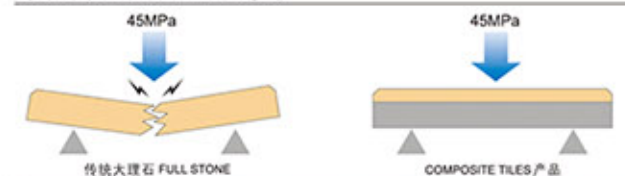

1. Safety: the standard weights of the aluminum honeycomb laminated panels and the aluminum plastic laminated panels are only 1/5 of common stone panels, which greatly reduce the self-weight of buildings, and thus increase the safety of the decorations for internal and external walls of high-rises.
2. Energy Conservation & Environmental Protection: Especially for the aluminum honeycomb laminated panel owing to its special structure, the air inside aluminum honeycomb can efficiently decrease the heat conduction between indoor and outdoor, so as to achieve the effect of energy conservation. According to tests, its conductive coefficient is only 1/10 of common stone panels. What is more, the thickness of the product is only 3-6mm so that the utilization rate of stone is increased for three to four times and the natural resources are saved to large extent.
3. Outstanding performance: the test data from National Research Center of Testing Techniques for Building Materials reveal that all performance index of the super-thin stone panels overwhelm those of common stone panels (please see test reports for details).
4. Easy and convenient installation: we are able to provide different stone materials, products of different structures and forms according to customers' requirements, which can be applied to the decorations for both external and internal walls as well as ceilings. The materials and products are easy to be installed, which greatly speed up construction progress.

Green Porphyry

Porphyry, also commonly known as Cobblestone, makes it one of the strongest stones and most important materials both for paving and for cladding. It is not selected according to color, which vary greatly as a result of millions of years of moisture, oxides and concretions infiltration. The range of colors goes from grey to red and violet with several different shades. Porphyry stands wear and tear very well. It is resistant to all components of the atmosphere, such as ice and intense cold. Because of its chemical and physical features it is suitable for pedestrian areas and other areas subject to very heavy traffic.

Porphyry's anti-slip quality, even in wet and icy conditions, allow for the paving of the streets, courtyards, gardens, parks and the creation of street furniture items. Porphyry comes in a variety of forms such as: <1>Cobbles,<2> Kerbstone,<3>Natural Cleft Tiles,<4>Machined Surface Tiles, etc.
